

A 21st Century Model for Disseminating Knowledge

Robert Sedgewick
Princeton University

[joint work with Kevin Wayne]

A 21st Century Model for Disseminating Knowledge

- Mission accomplished?
- Taking the plunge
- A way forward
- Postscript

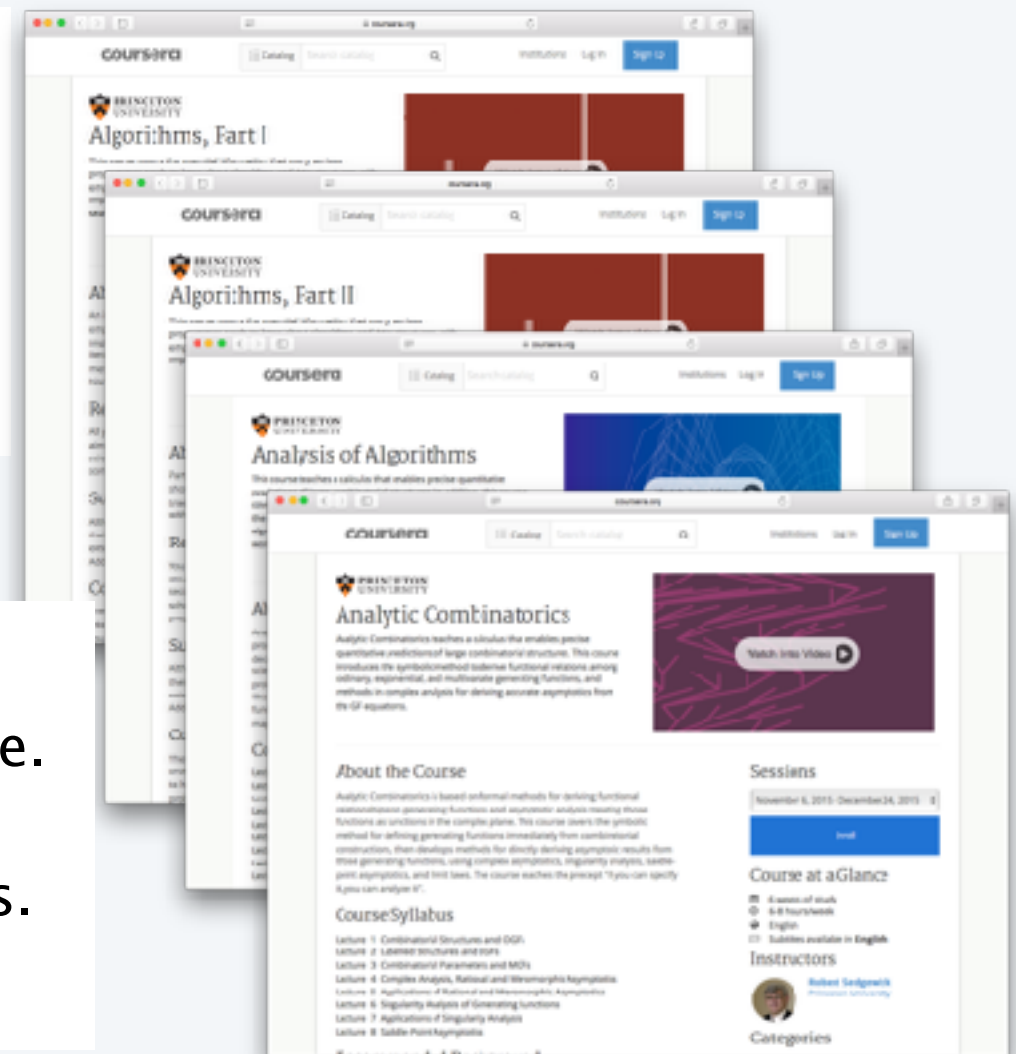

Brief summary of MOOC experience

Facts and figures

- Four courses produced and deployed.
- 45+ lectures, each running 60-90 minutes.
- 2000+ state-of-the-art lecture slides.
- **Over 1 million people reached.**

Distribution model is evolving (stay tuned)

- Coursera MOOCs completed in 2013, still active.
- Each course has an associated textbook.
- Lecture videos also bundled with the textbooks.
- Each textbook has associated web content.

Q: What's been happening since 2013?

[More details in this lecture \(available online\)](#)

Fundamental challenge for teaching CS (1975-present)

Standard textbooks have been the norm in most fields in the US for decades.

Physics

Chemistry

Economics

Biology

Calculus

**Computer
Science**

Central thesis (RS, 1975, 1992)

All college students need courses in **computer science** and **algorithms**

Computer science embraces a significant body of knowledge that is

- intellectually challenging
- pervasive in modern life
- critical to modern science and engineering

Anyone can learn the importance of

- modern programming models
- the scientific method in understanding program behavior
- algorithms and data structures
- fundamental precepts of computer science
- computation in a broad variety of applications
- preparing for a lifetime of engaging with computation

Goal: A *standard intro text* for CS that can stand alongside other standard intro texts.

[decades of difficult challenges omitted.]

- Identify content
- Change content
- Interface with the computer center
- Choose programming language
- Dot-com bust (enrolls way down)
- Change programming language
- Staffing
- Political battles
- Competing courses
- Inadequate resources
- Abandon computer center
- Financial crash (enrolls way up)
- Windows, OS X, Linux
- ...

One more course (2015-16)

Computer Science: An Interdisciplinary Approach

- 25 years in development.
- Basis for Princeton's most popular course.

Online lectures (2015)

- 20 lectures, each running 60+ minutes.
- 1000+ state-of-the-art lecture slides.
- [Not \(yet\) a MOOC \[long story\]](#).
- Available at InformIT (~\$30).

Textbook (2016)

- ~1000 pages
- Programming, algorithms, theory, architecture ...
- Turing, von Neumann, Boole, Shannon ...

Time to declare victory?

Goal: A *standard intro text* for CS that can stand alongside other standard intro texts.

Introduction to CS enrollments

- *Triple* the height of the “bubble”
- 2/3 of all Princeton students
- Largest course at Princeton

“Algorithms” enrollments

- *Four times* the height of the “bubble”.
- 40% of all Princeton students.
- 4th largest course at Princeton

A 21st Century Model for Disseminating Knowledge

- Mission accomplished?
- **Taking the plunge**
- A way forward
- Postscript

Sudden realization (2015)

20th Century

21st Century

Exactly how are we going to be teaching computer science *at Princeton* in the future?

RS: Hey, we *have* to use the studio-produced lectures!
Everyone else: *Why would we change our biggest and best course?*

details of debate omitted

[Months of difficult negotiations omitted.]

- Students won't watch
- Rules won't permit it
- Will require preparation of new material
- Who will teach it
- How do we change videos?
- Video editing
- Who can watch them?
- Staff will need to reteach
- System won't support it
- Too hard to set up
- ...

Last live lecture (September 2015)

Glitches (not unusual)

- Over 90 degrees in the room.
- Biggest lecture hall on campus is too small.
- Students in aisles cannot see the screen.
- Sound system stops working halfway through.

Consequence. All students motivated to move online!

An unqualified success

Q. What do you think of the online lectures?

A. **82%** of responses were positive+.

Students *loved* active participation in consuming lecture content

- “Prepares me for a lifetime of active learning online.”
- “I like this system, it really lets me go at my own pace and rewatch if I need to.”
- “The video lectures are **amazing**. I believe many classes would benefit from this.”

Course staff also reaped benefits

- No need to reteach lecture material in office hours.
- More time for interaction with students in small groups.
- More time for interaction in large class meetings.
- Scheduling complications virtually eliminated.

A 21st Century Model for Disseminating Knowledge

- Mission accomplished?
- Taking the plunge
- **A way forward**
- Postscript

Purpose of the university

is to *produce and disseminate knowledge*

Holy grail for research faculty

- Excellence in teaching.
- Devotion to research.
- *Simultaneously.*

A new model for teaching (this talk)

- *Replace live lectures* with online videos.
- *Embrace technology* for efficiency.
- Focus on *helping students succeed*.

20th-century textbook model

was a standard for introductory courses (in the US) *and is still widely used*

“20th century textbook” model

- “Standard” textbooks emerge after significant investment by authors/publishers.
- Distribution model: Teachers “adopt” and students buy textbooks.
- Teachers prepare and deliver lectures (perhaps using author’s slides).
- Teachers assess, grade, and certify students.

Pain points

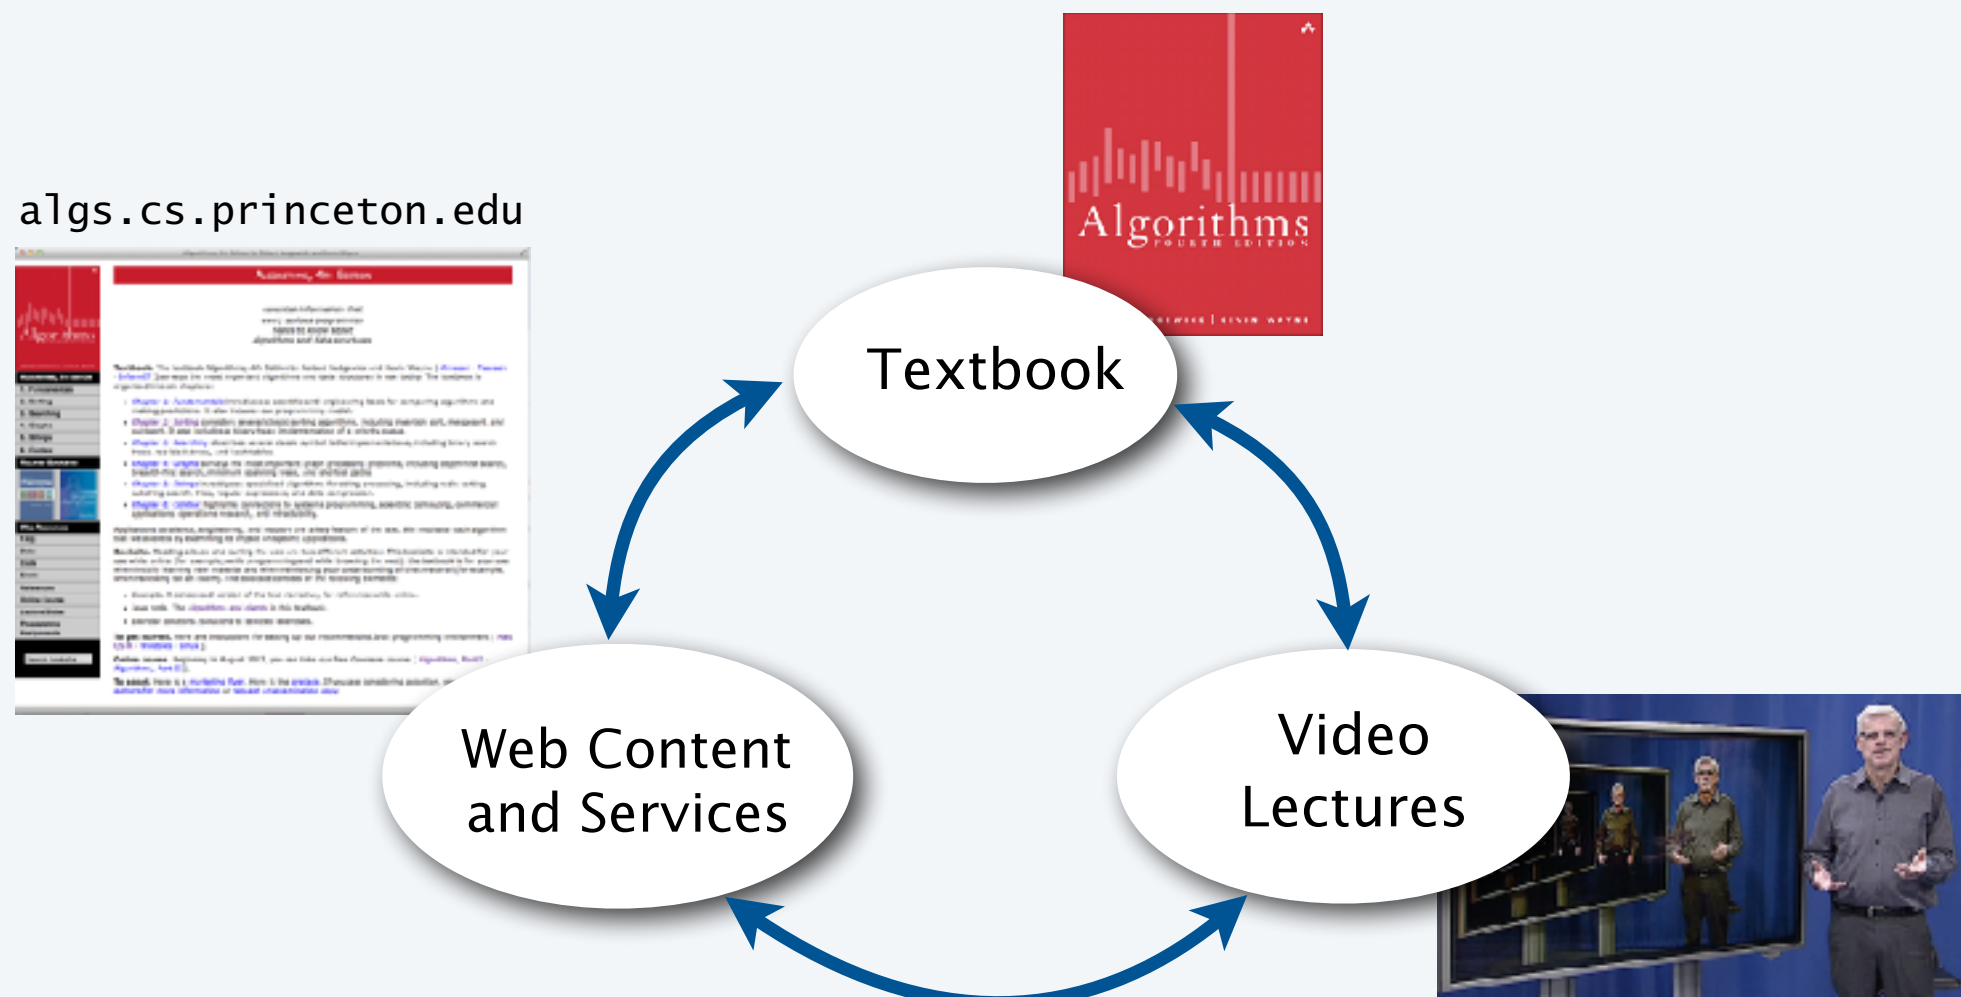

- Inefficiency of adjuncts/professors preparing and delivering “identical” lectures.
- Textbook publishing imploding after move to rental model.
- Passive lecture experience has become unsustainable.
- Assessment efforts generally do not scale.

21st-century textbook model

embraces technology to integrate four abstractions that are *here to stay*

“21st century textbook” model

- Authoritative **textbook** for use to *learn* and *study* the material.
- Studio-produced **video lectures** that *introduce* content and *inspire* more study.
- **Web content** for use to *explore* and *interact* with the material.
- **Web services** for use by teachers to *assess* and *certify* student learners.

Benefits: Consistent, scalable, and flexible support of *active* teaching/learning.

Algorithms textbook

Algorithms, Fourth Edition

Classic text for decades, 750,000+ sold.

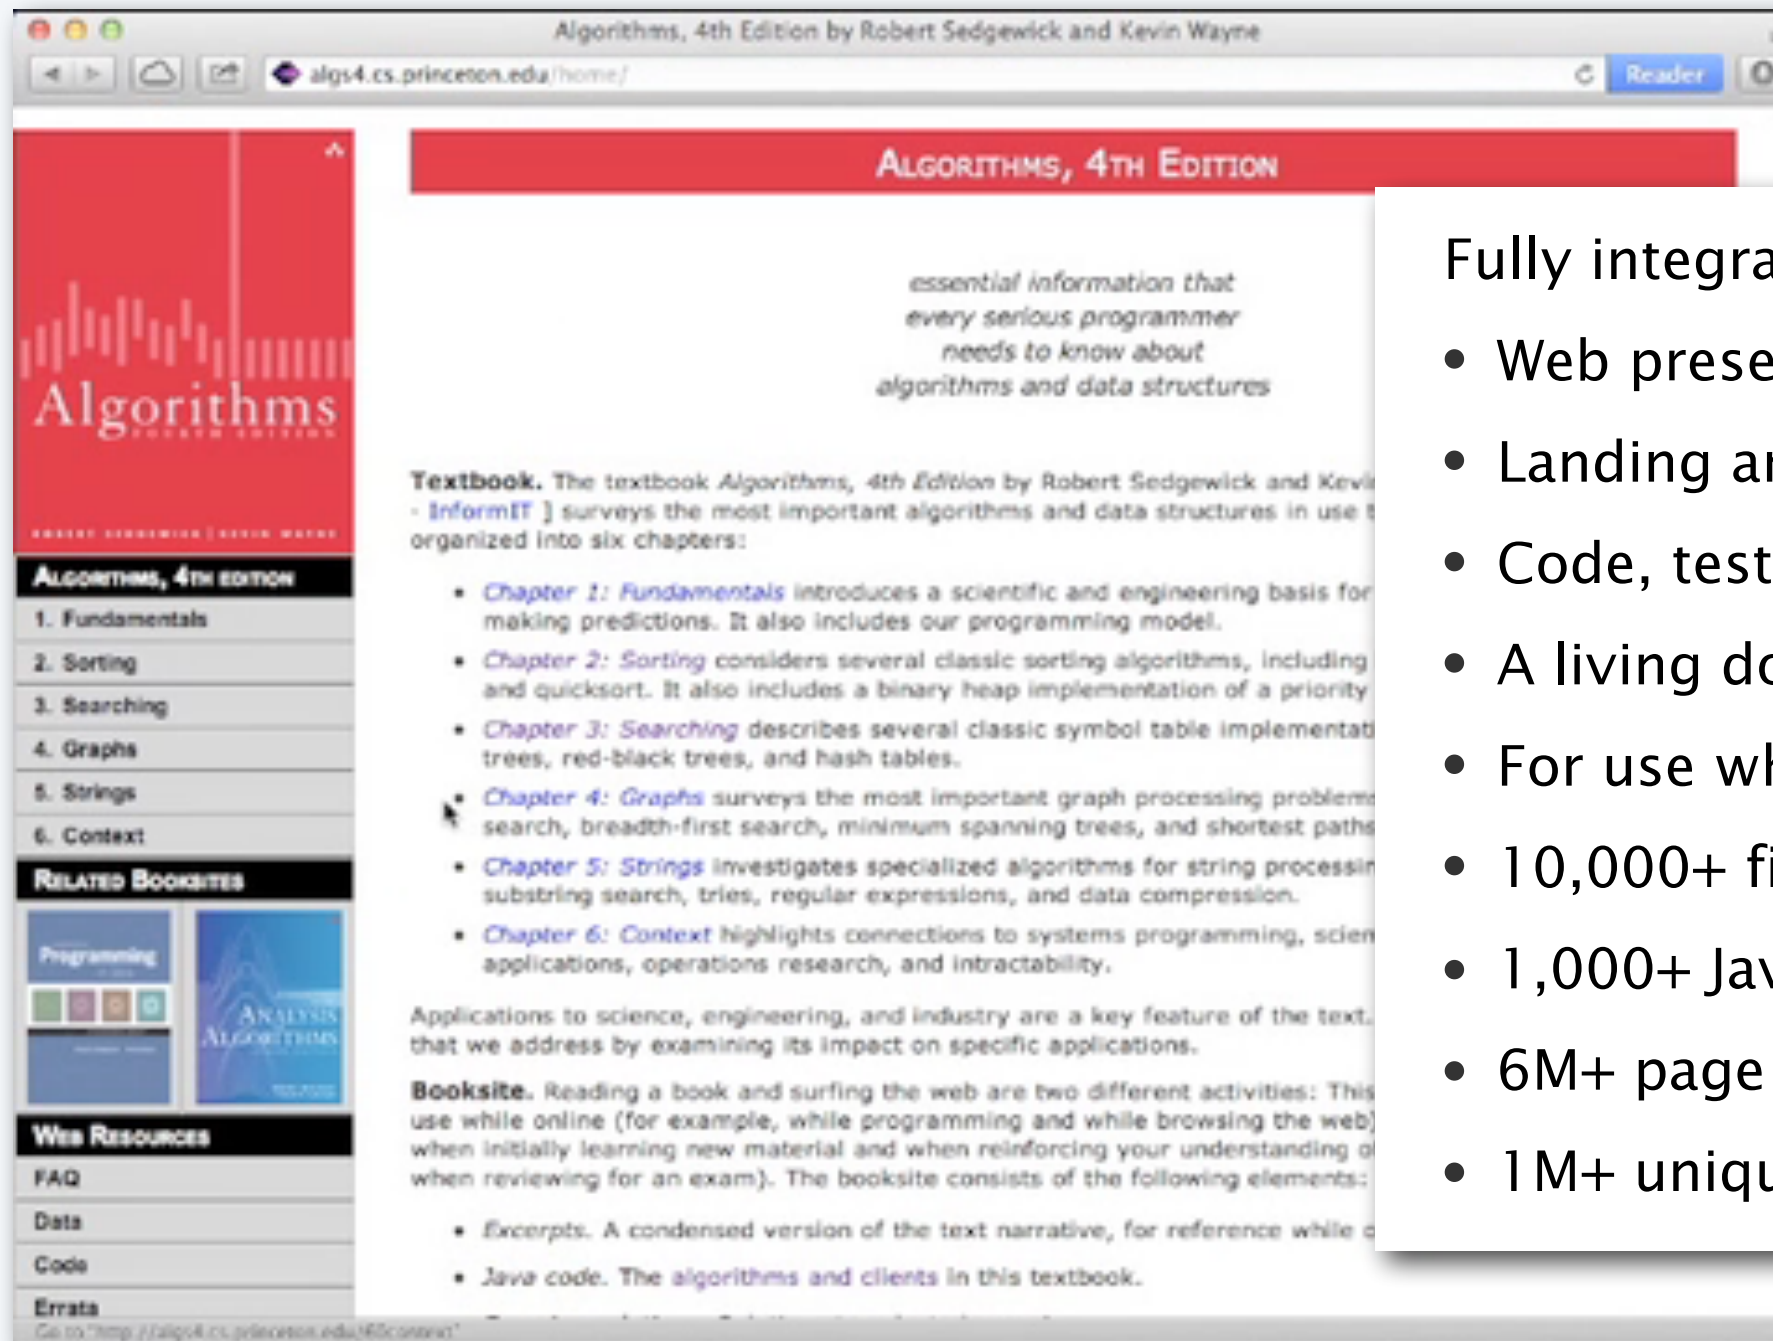

- “Algorithms with code”.
- Modern programming model.
- Model course in ACM-IEEE curriculum.
- Completely revamped each decade.
- Widely used around the world.

	<i>edition</i>	<i>goal for code: clear, readable and</i>
1970s	1st	<i>compiles</i>
1980s	2nd	<i>runs on examples</i>
1990s	3rd	<i>meets performance specs</i>
2010s	4th	<i>industrial strength</i>

Algorithms web content

<http://algs4.cs.princeton.edu/>

Fully integrated with the textbook

- Web presence.
- Landing and takeoff for search.
- Code, test data, animations.
- A living document.
- For use while coding, exploring.
- 10,000+ files.
- 1,000+ Java programs
- 6M+ page views in the past year
- 1M+ unique users in the past year

Developed by Kevin Wayne since the mid-2000s

Algorithms online lecture videos

Fully integrated with textbook

- A “top 10 MOOC of all time”.
- 24 lectures, about 1.5 hours each.
- Also distributed by Pearson/InformIT.
- Widely used around the world.
- Have reached 1M+ people.

Stack iterator: linkedlist implementation

```
import java.util.Iterator;

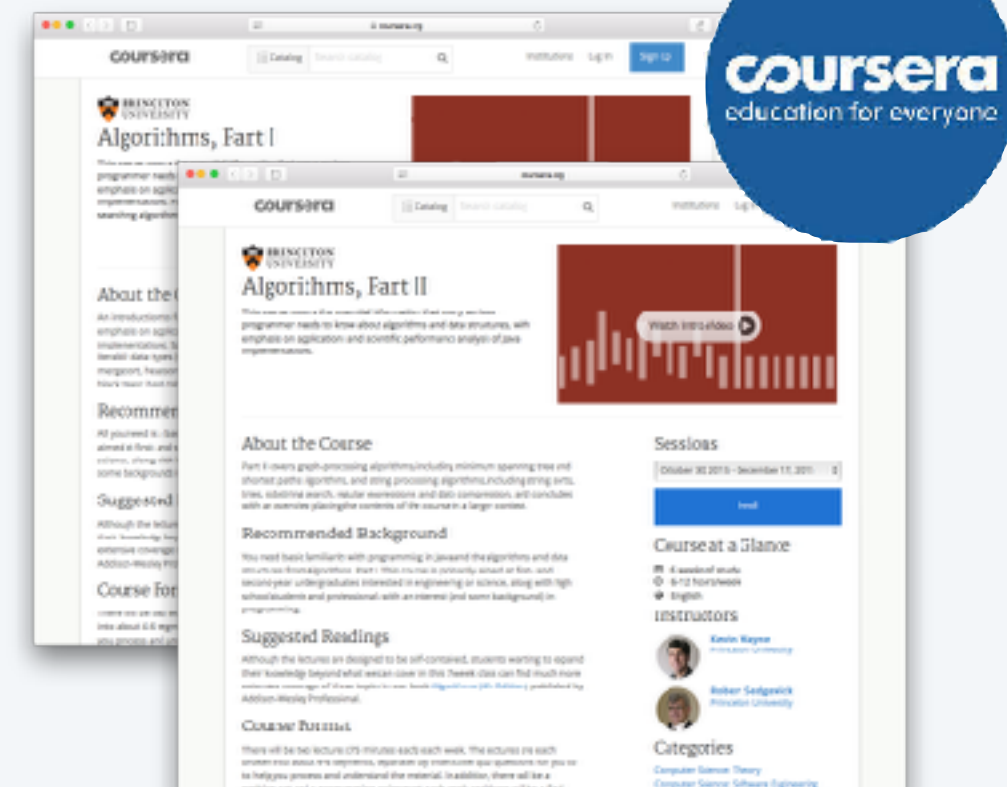

public class Stack implements Iterable<Item> {
    // ...

    public Iterator<Item> iterator() { return new ListIterator(); }

    private class ListIterator implements Iterator<Item> {
        private Node current = first;

        public boolean hasNext() { return current != null; }
        public void remove() { /* not supported */ }
        public Item next() {
            Item item = current.item;
            current = current.next;
            return item;
        }
    }
}
```

First → current → next → The → ses → It → null

Algorithms web services

Video delivery platform

Forums and Q&A

Program assessment infrastructure

- File system/interface for student submissions.
- Dispatch mechanism to support human commentary.
- Used for many CS courses at Princeton.

Automated program testing (stay tuned)

- Extensive fine-grained automated testing.
- Correctness (of course).
- Sophisticated performance and probabilistic tests.
- Deployed in an AWS docker container.

Quizzes and exams (stay tuned)

- Random questions drawn from templates.
- Hundreds of templates; millions of questions.
- Auto-graded for self-assessment.
- Web service in a cloud server.

Algorithms automated assessments: quizzes and exams

Example 1: Combinatorial questions

- ? Every problem in NP is also in P.
- F No problem is in both P and NP.
- T If $P = NP$ there is a polynomial-time factoring algorithm.
- ? If $P \neq NP$ there is a polynomial-time factoring algorithm.
- T There is a Turing machine that can decide whether the number of 1s on its input tape is prime.
- .
- .
- .
- F The Halting Problem is NP-complete.
- T The Traveling Salesperson Problem is NP-complete.
- T There is a deterministic Turing machine that can solve every problem in NP.
- T There is a DFA that can recognize binary strings that have 1 million 0s and 1 million 1s.
- T No polynomial-time algorithm can solve the Halting Problem.

8. Computability/Intractability (5 points). For each of the computational problems below, indicate its difficulty by writing the most appropriate choice of T (true), F (false), or $?$ (nobody knows) in the blank at left.

- A. _____ Every problem in NP is also in P.
- B. _____ There is a DFA that can recognize all binary palindromes.
- C. _____ There is a Turing machine that can decide whether the number of 1s on its input tape is prime.
- D. _____ No polynomial-time algorithm can solve the Halting Problem.
- E. _____ If $P = NP$ there is a polynomial-time factoring algorithm.

$$\binom{50}{5} = 2\text{M+ questions}$$

50 facts

Algorithms automated assessments: quizzes and exams

Example 2: Data-driven questions

Q17. String sorts. The column on the left is an array of strings to be sorted. The column on the right is in sorted order. The other columns are the contents of the array at some intermediate step during one of the algorithms below. Write the letter corresponding to the correct algorithm under the corresponding column. You will need to use some letters more than once.
Hint : Do not trace code—think about algorithm invariants.

Courses / Demo Course / Union Find

Quick Find

Attempts Remaining: 2

Quiz Ends in 12 days.

New Attempt

Attempts ▾

Seed: 56642 (Provider: QuickFindExercise)

If you wish to discuss a particular question and answer in the forums or with a instructor, please post the entire question and answer, including the explanation (which contains the correct answer). Also, be sure to include the question number (located in the URL), seed, and provider which uniquely identify this question.

Note If you are unable to submit, take a screenshot, and then try refreshing the page. In most cases, refreshing will resolve any issues with the interface. Refreshing the page will keep the current attempt – it will not start a new attempt. If that doesn't work, reach out to an instructor for help. Make sure to send the screenshot of the issue!

Give the `id[]` array that results from the following sequence of 6 union operations on a set of 10 items using the quick-find algorithm.

8-9 3-5 2-8 4-3 3-7 8-7

Your answer should be a sequence of 10 integers, separated by whitespace.

Recall: our quick-find convention for the union operation `p-q` is to change (and perhaps some other entries) but not `id[q]`.

Typical Interview Questions

- Self-loops
- Generating random graphs
- Easier to implement

Answer

To specify an array or sequence of values in an answer, separate the values in the sequence by a space. For example, if the question asks for the first ten powers of two (starting at 1), then the following answer is acceptable:

1 2 4 8 16 32 64 128 256 512

0 1 2 4 4 3 6 3 2 0

[illegible]

7 / 7

- Self-assessments in a large flipped class.
- Generate huge database of questions for a MOOC.
- Easy to adapt for use in a fully online class.

Quality and consistency of assessments are *dramatically improved* via technology.

Algorithms automated assessments: programs

can be subjected to extensive fine-grained tests and graded *automatically*.

Programs are first checked with best-in-class tools

- Every program must *compile*.
- *Style checks* help develop best-practice programming habits.
- Automatic *bug-finding* is essential (“because it’s easy”).

All assignments are based on a fully specified *API*, enabling

- *Correctness checks* (input-output pairs).
- *Timing tests* (essential in an algorithms course).
- *Memory utilization* (also essential in an algorithms course).
- *Probabilistic testing* (for randomized inputs or algorithms.)

Typical applications

- Grading programs in a large flipped class.
- Grading programs in a MOOC.
- Easy to adapt for use in an online class.

```
public class HelloWorld
{
    public static void main(String[] args)
    {
        // Prints "Hello, World" in the terminal window.
        System.out.println("Hello, World");
    }
}
```

100/100

Quality and consistency of assessments are *dramatically improved* via technology.

IF YOU DON'T TURN IN
AT LEAST ONE HOMEWORK
ASSIGNMENT, YOU'LL
FAIL THIS CLASS.

YEAH. BUT IF I CAN FAIL
THIS CLASS, THE GRADES
ON MY REPORT CARD WILL
BE IN ALPHABETICAL ORDER!

Bootstrapping

Courses produce large numbers of qualified students—why not put them to work?

Not-peer grading

- Feedback on code quality is *essential* for beginning programmers.
- Recruit students who have done well in the course to provide it. (they are *not peers*—they have another year of experience coding.)
- They can also provide *grades* to supplement automated process.
- Graders expand and reinforce their knowledge by doing so.

Software development

- Best students are *strongly motivated* to create a killer app.
- They also seek independent research projects.
- They also understand the shortcomings of existing software.
- Resulting software tends to be *far better* than otherwise available.

Content development

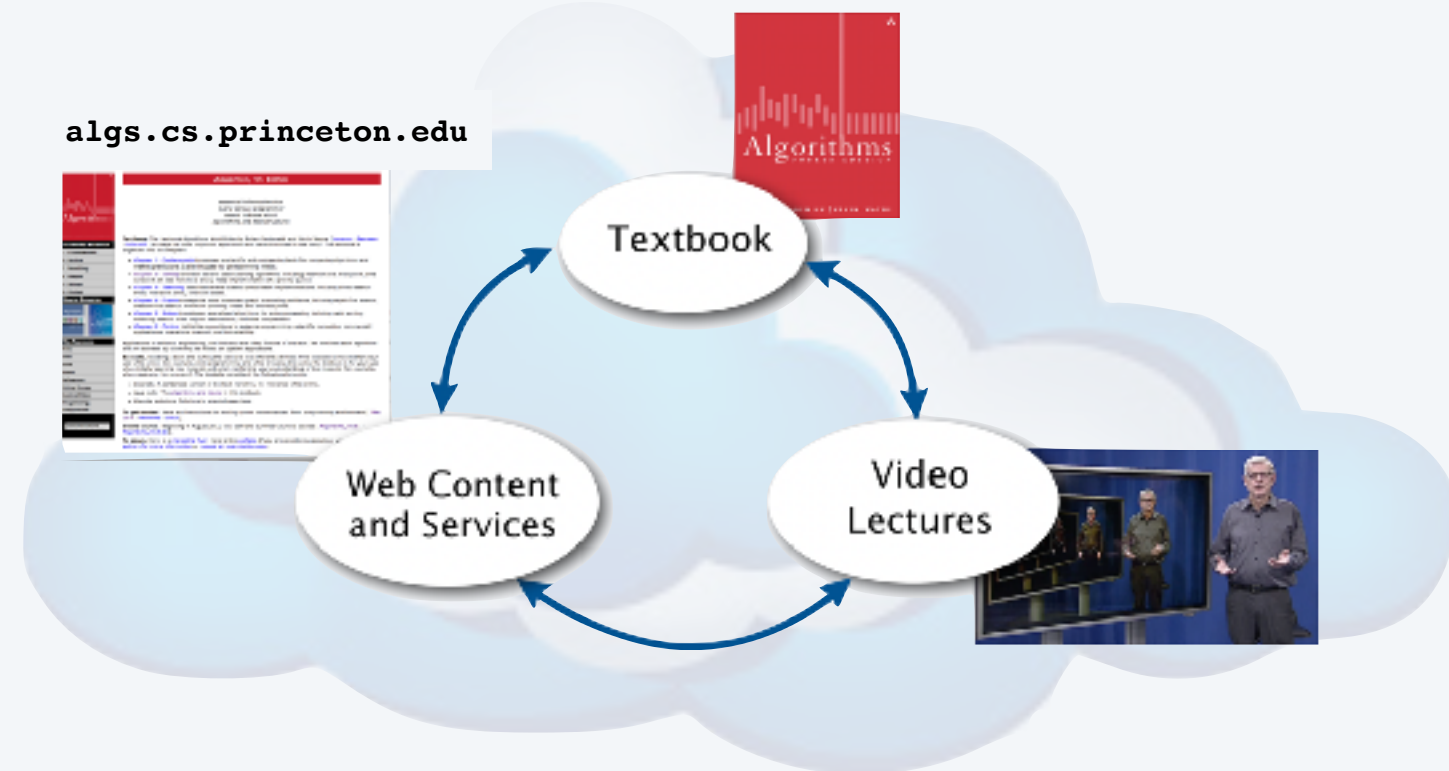

- All students are *strongly motivated* to understand nature of exam questions.
- *Ask them to write questions (and answers) and critique them publicly.*

ONLINE COURSE MATERIALS

This page provides access to online lectures, lecture slides, and assignments for use in teaching and learning from the book *Analytic Combinatorics*. It is appropriate for use by instructors as the basis for a "flipped" class on the subject, or for self-study by individuals.

Each lecture corresponds to a chapter in *Analytic Combinatorics*, so everyone is encouraged to study the corresponding chapter in conjunction with the lectures. If you view a lecture, you just spend an hour with the material; if you study the lecture slides and solve the assigned problems, you might spend several hours; if you dive into a topic by careful study of the book itself, you might find your self enjoying at least another order of magnitude of engagement with the material.

Flipped Class. If you are an instructor teaching analytic combinatorics, an effective way for you to teach the material in a typical college class is to adhere to a weekly cadence, as follows:

- Each week, send an e-mail note to all students in the class that briefly describes assignments for that week (lectures, reading, and problem sets). The e-mails used in the Spring 2017 offering at Princeton are accessible in the [lectures](#) page. Please feel free to edit them and use them in your own class.
- Students watch the lectures at their own pace, do the reading and work on the problem sets (each lecture comes with a few suggestions for assignments, which instructors typically tailor to their own needs).
- A weekly "class meeting" is scheduled for discussion of the material, reviews for exams, informal interaction between students, and any enrichment material you may wish to cover.

Important note: A common mistake in teaching a flipped class is to add too much enrichment material. Our experience over time in class meetings is much better spent preparing students for success on problem sets and exams. If an instructor finds it clear that the best way to prepare for exams is to watch the lectures and do the reading, most students will do so. Class meetings then can involve interacting with students and with the material in such a way as to reinforce understanding. For example, having students prepare and discuss potential exam questions is an excellent activity. You can find some examples and examples at right in the table below.

Self-study. An effective way to learn the material on your own is to play the lectures on some regular schedule, do the associated reading, and attempt to solve some of the assigned exercises on your own. If you get stuck on a particular exercise, find some others in the book or on this website, or try to solve some of the problems given in the lecture slides, looking at the solutions there. In the future, we plan to add more exercises with solutions to this website, but that is in progress.

While some of the reading material may be difficult for a typical undergraduate to master on such a quick pass through, a substantial fraction of the coverage is elementary, and the lectures provide a firm basis for understanding the key concepts. At Princeton, we use these materials to teach the second half of a senior-level undergraduate course (the first half of the course covers *An Introduction to the Analysis of Algorithms*).

At Princeton, we use these materials to teach the first half of a senior-level undergraduate course (the second half of the course covers *An Introduction to the Analysis of Algorithms*).

WEEKLY ASSIGNMENT	LECTURE VIDEOS	LECTURE SLIDES	Q&A
	1. Introduction (Fundamentals) (Prerequisites: Discrete Math) 2. Analysis of Algorithms 2.1 Recursion 2.2 Asymptotic 2.3 Quicksort 2.4 Merge Sort	AC01-Intro.pdf AC02-Recursion.pdf AC03-Asymptotic.pdf AC04-Quicksort.pdf AC05-Merge Sort.pdf	Guidelines ACq01.pdf
ACweek1.txt Note 1.23 Program 1.2 Note TL1.1	3. Recursion 3.1 Computing 3.2 Scheduling 3.3 Trees 3.4 Merge Sort		

Weekly cadence for professor (2-3 hours per week)

- Send e-mail to students describing lectures and assignments.
- *Students watch lectures online.*
- *Students complete problem sets (as usual).*
- Meet with students to work on prototypical exam questions.
- Monitor online Q&A forum.

Bottom line: Better learning outcomes, more time for research.

A 21st Century Model for Disseminating Knowledge

- Mission accomplished?
- Disruptive changes
- Taking the plunge
- A way forward
- **Postscript**

A parting thought

(from *John Hennessy* in an interview for an article by Ken Auletta the New Yorker, 2012)

“[Universities,] like newspapers and music companies and much of traditional media a little more than a decade ago are sailing in seemingly placid waters.”

“But ... *there's a tsunami coming.*”

What happened to the tsunami?

I think the bloom is now off the rose, and now is going to be the time when some really hard-nosed thinking has to be done about the true value of these online courses.

Shirley Tilghman, 2013

Stumbling blocks

- *Institutions* are trying to take control (and failing).
- Content creation is the province of *individuals*.
- Bad business models, created prematurely.

Result: Plenty of lost opportunities.

RS: Looks like a tsunami to me!

- Tens of thousands of pages of online content
- 100+ hours of lecture videos.
- Reaching millions of individuals.
- 1990s: Lucky to be able to teach my own children.
- 2030s: Will be teaching my own *grandchildren*.

A 21st Century Model for Disseminating Knowledge

Robert Sedgewick
Princeton University

[joint work with Kevin Wayne]
